Violence

Teachers often work with students whose behavior puts them, other students and staff at risk of harm. Teachers are responsible for the safety of children under their supervision. That responsibility extends to protecting or reducing the severity of potential student injuries, including those from fighting or assaults. Physical intervention is not required if it would create a physical danger to you. However, common sense and reasonableness require the use of steps such as:

• Calling for assistance, sending someone for help, or calling 911 if the altercation is out of control.
• Dispersing the crowd. By removing the audience, the motivation to fight may be reduced.
• Removing or pushing aside items from the area. This will reduce the risk of further injury due to falls. It will also keep students from using these objects as weapons.

You can protect yourself and minimize the risk of assault through your local association by:

• Ensuring that the child or children assigned to you have been properly classified.
• Seeking inservice training on topics such as:
  • Intervening safely in student fights and conflicts.
  • Reducing staff victimization.
  • Handling angry parents.
  • Weapons awareness.
• Joining or helping to form an association health and safety committee to work on these issues by:
• Ensuring that any school safety plan puts the full responsibility on the district for protecting employees, and involves administration and law enforcement.

Bloodborne pathogens

Teachers often risk on-the-job contact with blood and other body fluids in their work with students. These materials may contain pathogens, organisms that can cause serious disease. The Bloodborne Pathogen Standard was created to protect employees with anticipated occupational exposure to these organisms.

What is the PEOSH Bloodborne Pathogen Standard?

In 1991, the federal OSHA adopted the Bloodborne Pathogen Standard that protects workers in the private sector who come in contact with blood or other body fluids that may cause serious disease. The following are of major concern:

• Hepatitis B virus (HBV)
• Hepatitis C virus (HCV)
• Human immunodeficiency virus (HIV), the cause of Acquired Immunodeficiency Syndrome (AIDS)

In 1993, the federal OSHA Standard was adopted under the New Jersey Public Employees Occupational Safety and Health (PEOSH) Act to protect public employees in New Jersey.

How does the law protect you?

• The employer must provide an exposure control plan that includes:
  • Job classifications of those responsible for clean-ups.
Bloodborne pathogens (continued from pg. 1)

- Engineering controls used to contain or remove hazardous materials, such as puncture resistant containers or splash guards.
- Hepatitis B vaccinations for all employees who have anticipated exposure to blood or other bodily fluids.
- Medical evaluation and follow-up for all employees who are exposed.
- Employee training for all employees with the potential for exposure.
- Confidential records about employee exposures must be kept for the length of employment plus 30 years.

Indoor Air Quality

School employees spend most their workdays in school buildings and offices. The World Health Organization estimates that approximately 30 percent of all buildings have an IAQ problem. Much research and attention has been focused on a whole host of indoor air contaminants and stressors in buildings. Formaldehyde, radon, bacteria, fungi, carbon monoxide, hydrocarbons, particulates, nitrogen oxides, ozone, fiberglass, tobacco smoke, temperature, humidity and poor ventilation top the list, and may be a cause of IAQ problems.

Employee symptoms associated with IAQ problems may include eye, nose, throat, and upper respiratory irritation, skin irritation or rashes, chills, fever, cough, chest tightness, congestion, sneezing, runny nose, muscle aches, and pneumonia. Illnesses associated with IAQ problems include asthma, hypersensitivity, pneumonitis, multiple chemical sensitivity, and Legionnaires’ Disease.

How can IAQ Problems be corrected and/or prevented?

- Ensure an adequate outside air supply. The ventilation system should be operating at original design specifications.
- Eliminate or control known and potential sources of chemical and microbial air contamination.

What can be done if the air quality is unacceptable?

- Conduct employee interviews to obtain pertinent information regarding what symptoms are being experienced, how many employees are affected, when they are affected, where they work, what they do, etc.
- Review building operations and maintenance procedures to determine when and what type of chemicals are being used during cleaning, floor waxing and stripping, painting, gluing, pesticide spraying, roof repairs, renovation and construction activities, etc. Also determine when furniture deliveries occur since idling vehicles generate exhaust. New carpeting, upholstered furniture, partitions, etc. may give off chemical vapors for several months.
- Conduct a walk-through inspection to evaluate possible sources that may contribute to IAQ complaints.
- Inspect the heating, ventilation, and air conditioning (HVAC) system, window air conditioners, office dehumidifiers, etc., in order to determine if the systems are working properly and are in good condition.
- Check the schedule for cleaning any air filters present in the system.
- Review the building blueprints of the duct work and ventilation system to determine if the system is adequately designed.
- Conduct air sampling, if necessary, to determine if specific contaminants are present or if adequate fresh air is being supplied.
- Check compliance with the PEOSH Indoor Air Quality (IAQ) Standard.
